

Adaptive API Gateway Challenge (Student Guide)

Context

Server A recently moved from Version 1 (V1) to Version 2 (V2). The participant server is expected to help bridge the old and new models.

Goal

Implement a server that exposes `POST /solve` and returns a transformed payload based on the incoming request.

Required Endpoint

- `POST /solve`

Sample Request

The endpoint receives:

```
{
  "payload": "ewoJImFkYXB0SW5wdXQiOiB7CgkJInVzZXIiOiB7CgkJCSJpZCI6ICJVNDIiLAoJCQkiZnVsE5hb"
}
```

where the payload somehow decodes to this:

```
{
  "adaptInput": {
    "user": {
      "id": "U42",
      "fullName": "Jane Doe"
    },
    "action": "CREATE",
    "metadata": {
      "priority": "HIGH"
    }
  }
}
```

```
}  
}
```

Sample Response

Your `POST /solve` must return JSON in this shape:

```
{  
  "adaptOutput": {  
    "id": "U42",  
    "name": "Jane Doe",  
    "action": "create",  
    "priority": 3  
  }  
}
```
