

The rules that hold in every stage

Nothing here is stage-specific, and nothing here changes between stages.

Every response

LIMIT	VALUE
Tokens per tool response	1,200
Response time	10 seconds

This applies to **every response from every tool, in every stage**.

Tokens are counted with the `o200k_base` encoding over the text your tool returns:

```
import tiktoken
encoding = tiktoken.get_encoding("o200k_base")
total = len(encoding.encode(your_response))      # must be <= 1200
```

A response over the limit is **discarded**. The android is told your response was too large; it is not given a truncated version, because half a payload reads exactly like a whole one and would fail as a wrong answer rather than as a stated problem.

You'll be able to see your token use at the run summary page.

The tools you expose

We read at most **20** tools from your server.

If you advertise more than 20, we take the **first 20 your server lists** and the rest are not offered to the android. We do not choose which 20; the order is yours, so if you are near the limit, register the tools that matter first.

A tool must also be **reasonably sized**: its name, its description, and its parameter names. A tool that is not is **not offered to the android at all**: it is not called, and nothing about it is put in front of the android.
